

H2: All models will perform similarly and present comparable suitability predictions in metabolically “neutral” regions (NEP, CCS) and time periods (neutral ENSO phase).

H1: The AGI will improve model performance.

Pacific North Equatorial Current (NEC)

AGI > DO > Base

H3: The AGI model will outperform the DO and base model and provide more biologically realistic habitat suitability predictions in metabolically stressful regions (NEC) and time periods (El Niño, La Niña).
